

Cone Crusher Feed Plates

Valley Rubber custom manufactures Cone Crusher Feed Plates to suit the application. Offered in a variety of overall thicknesses, the rubber is vulcanized to a steel backing plate. A lifting point is included in the design for ease of installation and replacement. Rubber reduces noise and is effective in absorbing great impact while offering superior abrasion resistance over steel in the right application.

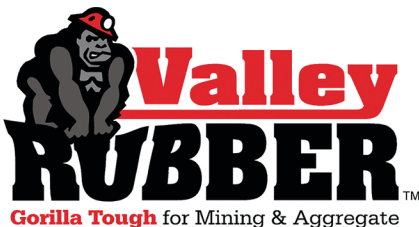

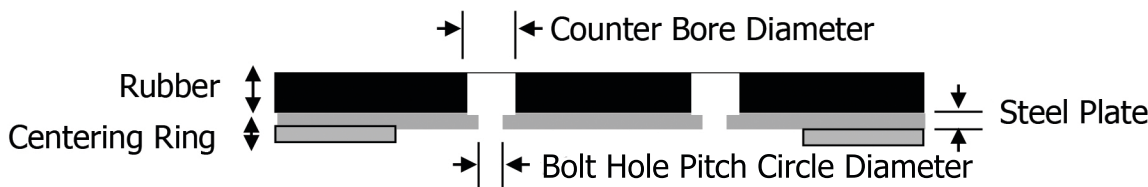

Specifications

Often dead bed rings are incorporated into the design in order to increase material-against-material wear to extend the life of the part. In addition, ceramic can be combined with the rubber for added abrasion resistance. Most plates are mounted through the top of the part using counterbored holes.

A/R Perimeter Bar is used around the circumference of the plate for choke feed applications to protect the rubber from shear forces. We offer a centering ring on the back of the feed plate when required.

Additional Benefits:

Reduced Cost Per Ton, Improved Plant & Equipment Availability, Enhanced Profitability, Easy Installation, and Easy Maintenance.
